

Biotopol®

Simple to use:
10 ml per 40 l water.
New aquariums: Dose for the total amount of Water.
Water changes: Dose for the amount of water changed, however, dosing for the total amount of water has no disadvantages and instead increases the protective power.

Biotopol®

Chlorine, Chloramine
Heavy metals

 Without Biotopol
 With Biotopol

JBL Biotopol is vital for any aquarium as it permanently converts harmful tap water into healthy aquarium water. Neutralising harmful compounds is the only way for fish and plants to thrive in an aquarium as well as they would in their natural habitat.

JBL Biotopol is effective by:

1. Protecting gills, skin and fins with special organic protective colloids and aloe vera.
2. Permanently neutralising toxic heavy metals such as copper, lead, zinc etc.
3. Quickly and efficiently removing harmful chlorine and chloramine.
4. Concentrated Vitamin B complex protects the fish's mucous membrane from stress and reduces the risk of disease.
5. Adding essential natural ingredients (plant matter, colloids etc.) to the tap water so that the fish find the same substances they know and need from their natural habitat.
6. Making iron accessible to plants.

When to use JBL Biotopol?

- When setting up a new aquarium and when doing water changes
- In conjunction with JBL Acclimol to fortify fish after treatment for disease
- An hour before the use of bacterial starters (JBL Denitrol or JBL FilterStart)
